

Assignment 5: Colorful Static

For this assignment, you will use Pygame to display a 2-D grid of cells. For each game frame, you will randomly assign a color to the cells and then draw them. The result will look like colored static. This assignment sets us up to start experimenting with agent-based modeling in our next classes.

Instructions

- Use the attached `pygame-skeleton-no-sprites.py` file as a starting point.
- In your `__init__` method:
 - Initialize the screen size to 1280 pixels by 720 pixels
 - Create a 2-dimensional list of cells, all containing the value 0
- In your `update` method:
 - For each cell:
 - Set its value to a random number between 0 and 3, inclusive
- In your `draw` method:
 - For each cell:
 - If the cell value is 0:
 - Don't do anything
 - Else:
 - Figure out the rect coordinates for this cell
 - Draw the rect using a color corresponding to the value of the cell: 1 = red, 2 = blue, 3 = green

The output should look something like this, but with the cells randomly changing colors each frame.
